

## In the Claims

Please amend the claims follows:

1. (Currently Amended) A system for executing a financial transaction to purchase or sell a plurality of financial instruments, the system comprising:
  - a memory adapted to store a plurality of orders or quotations to purchase or sell the financial instruments, the orders or quotations including at least one complex order, the complex order including a plurality of legs, each leg being an order to purchase or sell at least one of the financial instruments;
  - a processor coupled with the memory; and
  - a matching algorithm coupled with the processor and adapted to match each leg of the at least one complex order with other orders or quotations stored in the memory.
2. (Currently Amended) The system of claim 1, wherein matching each leg of the at least one complex order is contingent on matching all of the legs of the complex order.
3. (Original) The system of claim 1, wherein the complex order further comprises a net price and wherein the matching algorithm matches the complex order based on the net price.
4. (Currently Amended) The system of claim 1, wherein the plurality of financial instruments includes at least one options ~~contracts~~ contract.
5. (Currently Amended) The system of claim 4, wherein the plurality of financial instruments includes at least one order to purchase or sell stock underlying the at least one options contract.
6. (Original) The system of claim 1, wherein the plurality of financial instruments includes at least one futures contract.
7. (Currently Amended) The system of claim 6, wherein the plurality of financial instruments includes an amount of a commodity underlying the at least one futures contract.
8. (Currently Amended) The system of claim 1, wherein the processor is adapted to periodically monitor the memory to determine if the at least one complex order can be matched.
9. (Currently Amended) The system of claim 1, further comprising a data interface coupled with the processor, wherein the data interface is adapted to receive best price information

- and wherein the matching algorithm is adapted to execute each leg of the at least one complex order at a best price.
10. (Currently Amended) The system of claim 1, wherein the processor is adapted to monitor the memory to determine if the at least one complex order can be matched on the occurrence of a market event.
  11. (Original) The system of claim 10, wherein the market event includes a change in best price information.
  12. (Original) The system of claim 10, wherein the market event includes the storage of a new order or quotation in the memory.
  13. (Currently Amended) The system of claim 1, further comprising an arrival delay timer, the arrival delay timer delaying execution of the matching algorithm for a period time from when the at least one complex order is stored by the memory.
  14. (Currently Amended) The system of claim 1, wherein a plurality of second complex orders are stored in the memory, and wherein the matching algorithm is further adapted to identify a best inverse complex order corresponding to the complex order from among the plurality of second complex orders.
  15. (Currently Amended) The system of claim ~~14~~ 1, wherein the ~~plurality of~~ at least one complex ~~order~~ orders each include includes a net price and wherein complex orders with a more favorable net price are ranked with a higher ~~execution~~ priority for execution.
  16. (Currently Amended) The system of claim ~~14~~ 1, wherein the at least one complex order includes orders associated with non-professionals and professionals, and wherein complex orders from non-professionals are ranked with a higher priority for execution than complex orders received from professionals.
  17. (Currently Amended) The system of claim ~~14~~ 1, wherein the at least one complex ~~orders~~ order stored earliest in time ~~are~~ is ranked with a higher priority for execution than complex orders stored later in time.
  18. (Currently Amended) The system according to claim 1, further comprising an execution processor coupled with ~~the complex order~~ the processor and adapted to execute the at least one complex order when ~~the~~ a net price of the at least one complex order is met or improved by either ~~the~~ a net price of ~~the~~ a second complex order or by ~~the~~ prices of the corresponding regular orders.

19. (Currently Amended) The system of claim 2 ~~9~~, wherein ~~an~~ the optimal price information reflects prices for an options ~~the option~~ contract on at least one away market.
20. (Currently Amended) The system of claim 1, wherein a number of option contracts for at least one leg of the at least one complex order is a ratio of a number of option contracts for at least one other leg of the at least one complex order.
21. (Currently Amended) The system of claim ~~10~~ 20, wherein the matching algorithm is adapted to match a portion of each leg of the at least one complex order based on the ratio.
22. (Currently Amended) The system according to claim ~~14~~, ~~8~~, ~~wherein the complex order is received from a customer~~, further comprising an obvious price error algorithm coupled with the execution processor and adapted to prevent execution of the complex order against ~~the~~ a second complex order if a price improvement by the second complex order is greater than an error prevention value.
23. (Currently Amended) The system according to claim ~~3~~ 1, wherein ~~the~~ a net price of the at least one complex order is determined from a current market price for each leg of ~~the at least one~~ at least one complex order.
24. (Currently Amended) A system for matching complex orders to purchase or sell a plurality of financial instruments, the system comprising:
  - a memory adapted to store a plurality of orders or quotations including ~~to purchase or sell~~ complex orders and regular orders;
  - a processor coupled with the memory to identify matches ~~between~~ among complex orders and regular orders; and
  - a matching algorithm coupled with the processor and adapted to match each leg of the complex order with a plurality of regular orders and quotations in a single transaction at a single net price, wherein the quantity of ~~each~~ at least one leg of the complex order ~~traded against the regular orders~~ is a ratio of at least one other leg of the complex order, and wherein the legs of the at least one complex order are matched and the legs are executed consistent with the ratio ~~complex order's ratios~~, and further wherein the regular orders ~~traded against the complex order~~ are selected based on an allocation algorithm pursuant to which each leg is allocated adapted to allocate preferentially first to any customer orders and next to ~~to~~ professional orders and quotations with larger size.

25. (Currently Amended) A system for matching complex orders to purchase or sell a plurality of financial instruments, the system comprising:

a memory adapted to store a plurality of orders or quotations including to  
~~purchase or sell~~ complex orders and regular orders;

a processor coupled with the memory to identify matches between at least one  
~~complex order~~ ~~complex orders~~ and a plurality of regular orders and quotations; and

a matching algorithm coupled with the processor and adapted to match each leg of the at  
least one complex order with the plurality of regular orders and quotations in a single transaction  
at a single net price.
